

AI Agent Dictionary

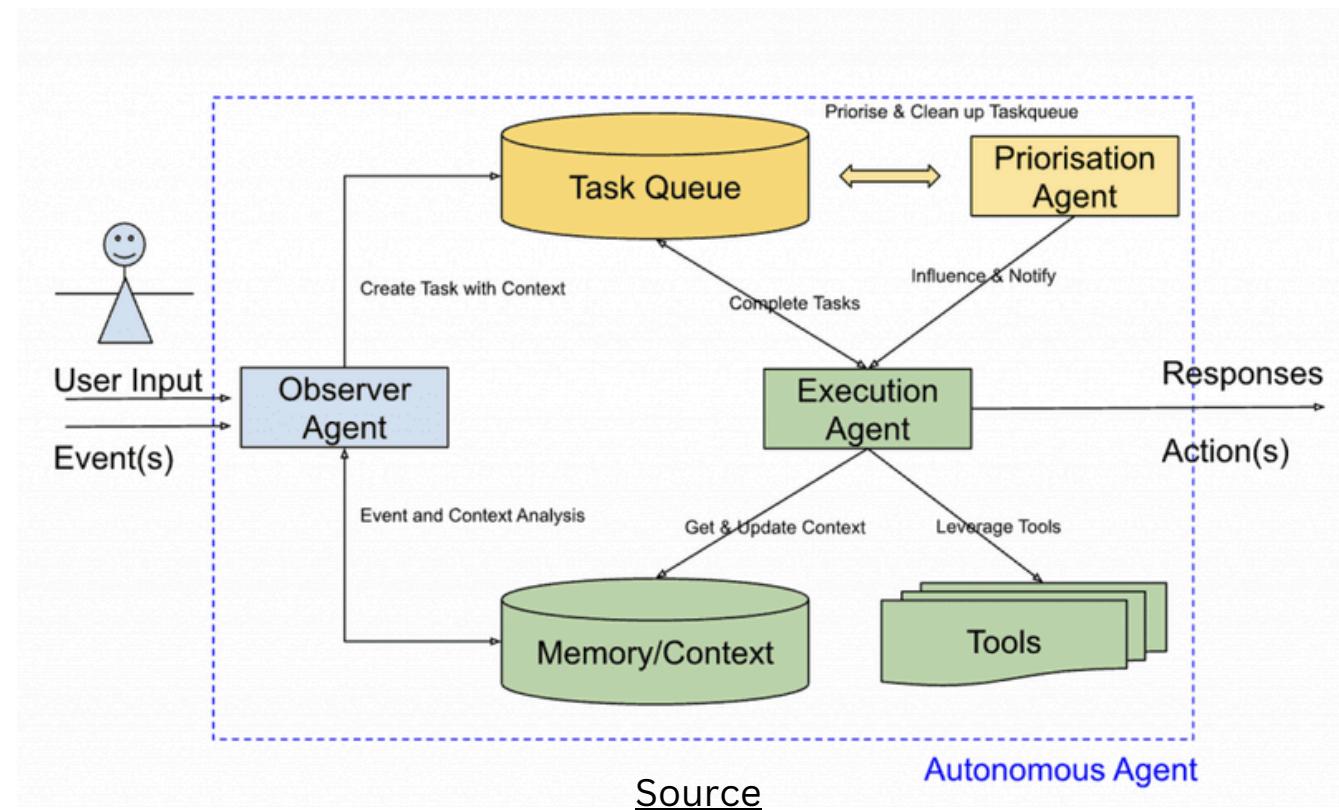

Your A-to-Z Guide to Mastering AI Agents

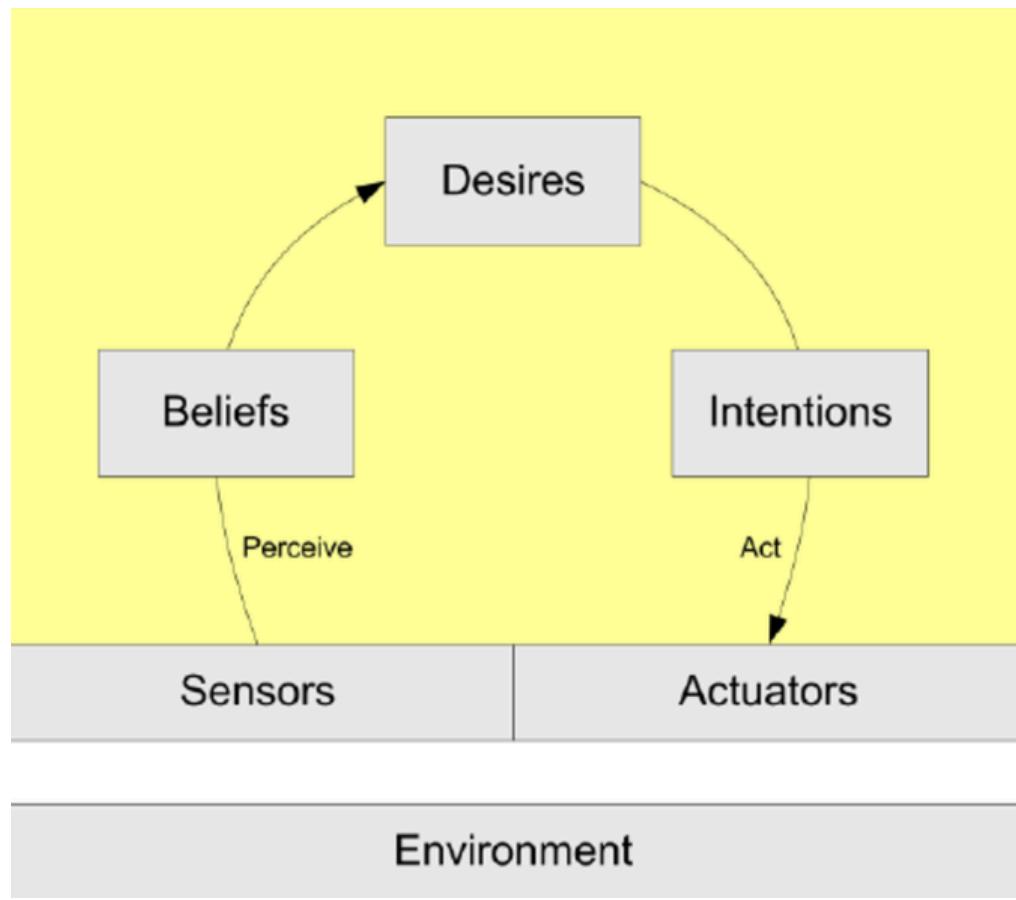

A - Autonomous Agent

An AI system that operates independently without human intervention.

- Observes the environment and takes actions.
- Can adapt based on experiences.
- Used in robotics, gaming, and automation.

B - Belief-Desire-Intention (BDI) Model

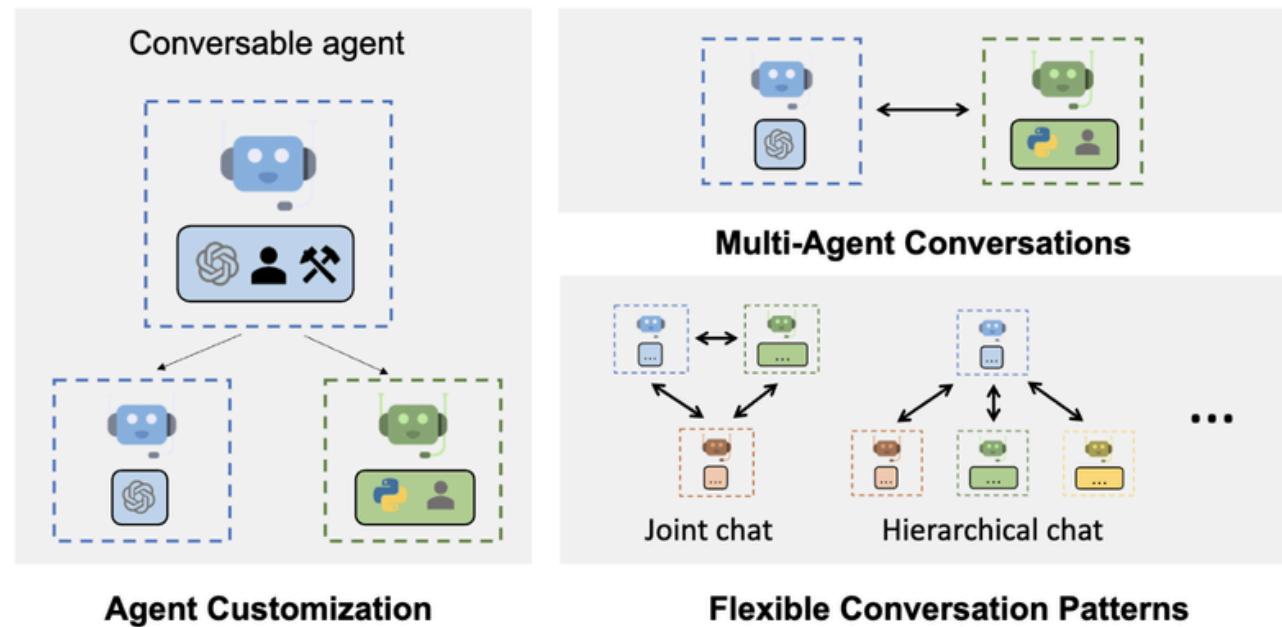

A decision-making framework for AI agents.

- Belief: What the agent knows.
- Desire: Goals it wants to achieve.
- Intention: Actions to fulfill desires.

C - Conversational Agent

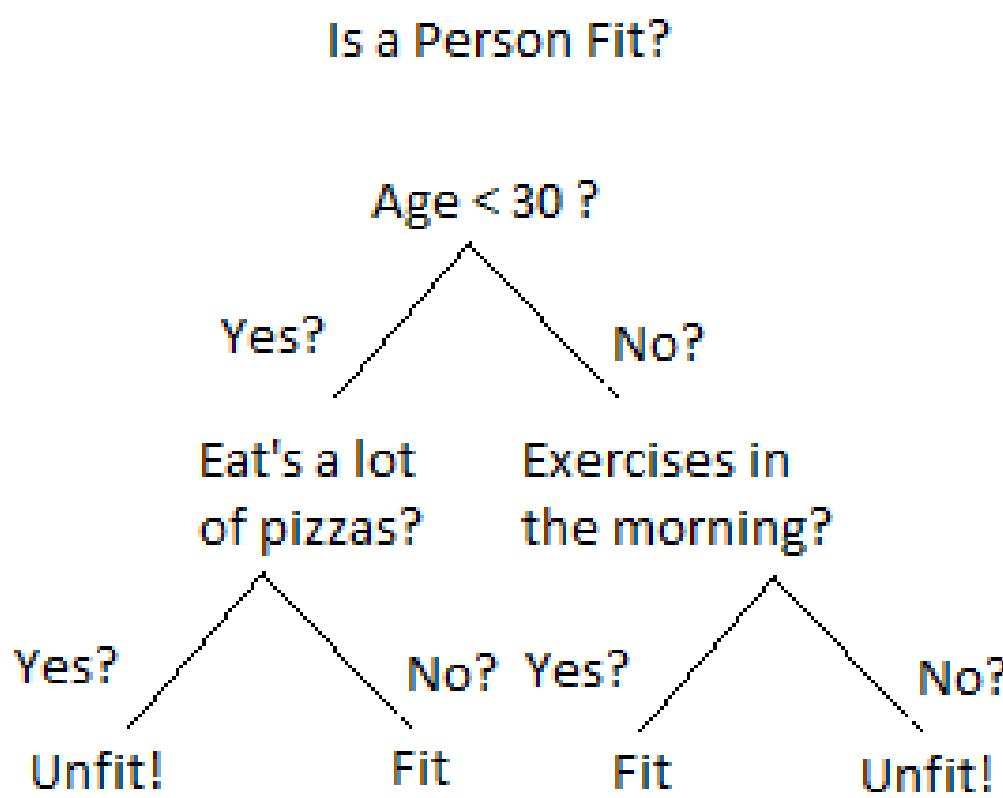

AI-powered chatbots or voice assistants.

- Understands natural language.
- Responds to user queries.
- Examples: ChatGPT, Siri, Alexa.

[Source](#)

D - Decision Tree

A flowchart-like model for decision-making.

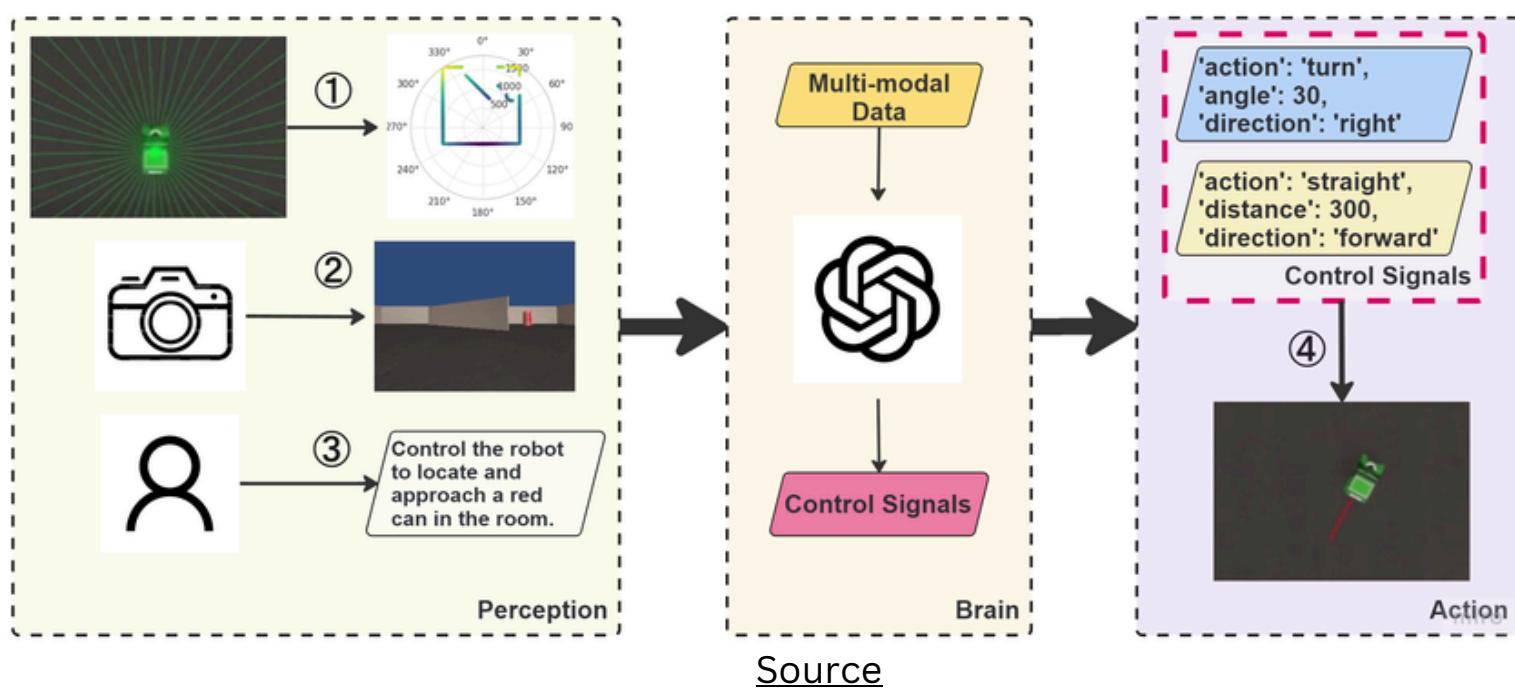

- Breaks problems into smaller steps.
- Uses “if-then” conditions.
- Common in rule-based AI systems.

[Source](#)

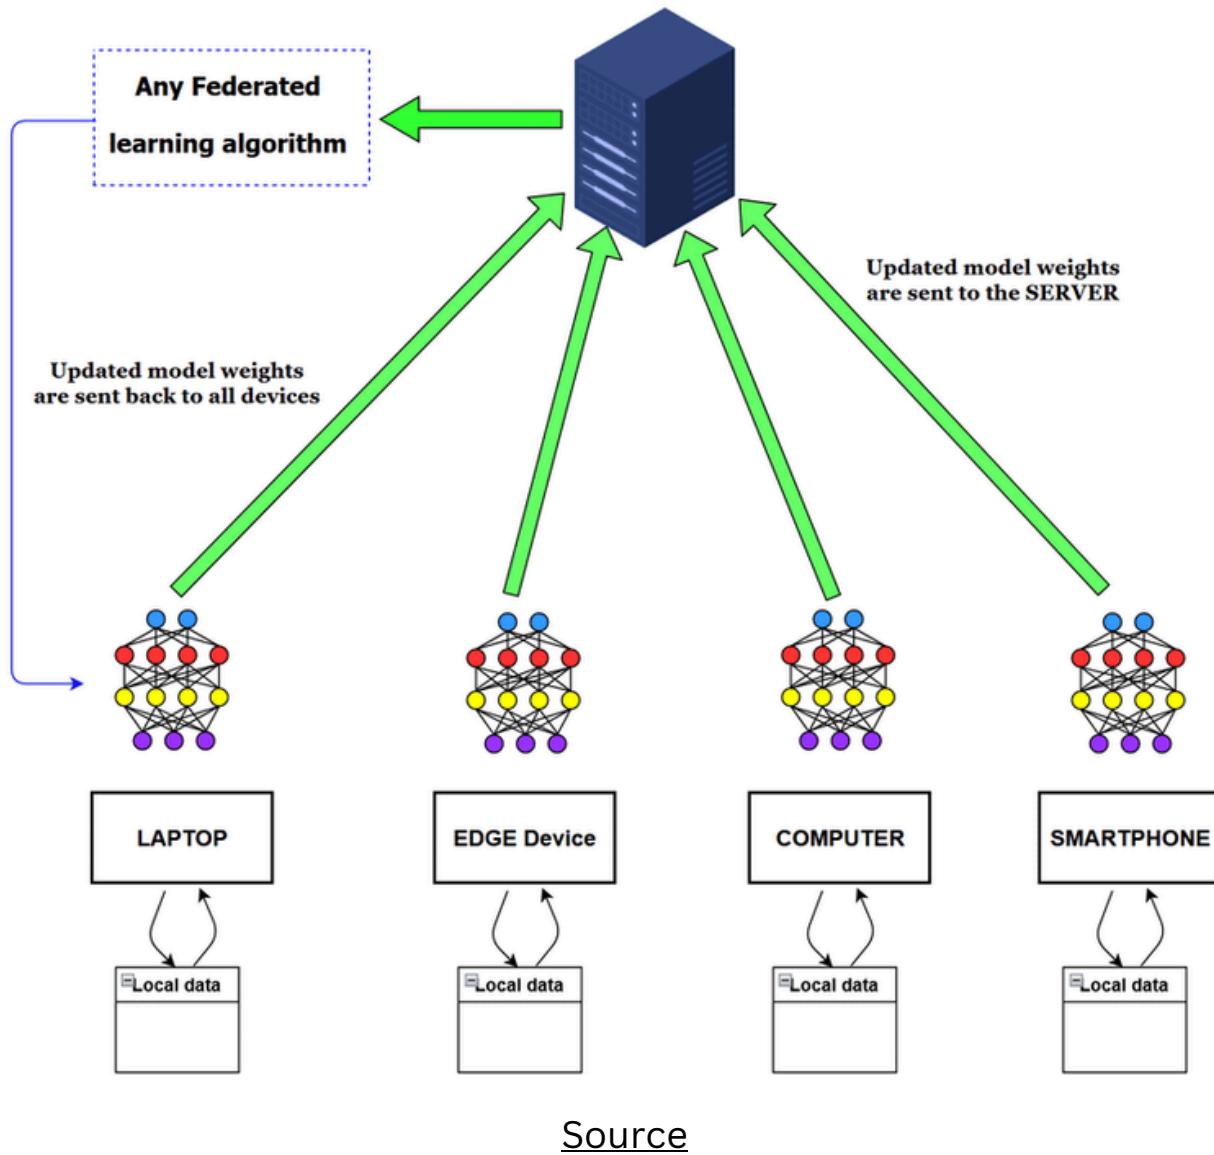

E - Embodied AI

AI with a physical or virtual presence.

- Can interact with the real world.
- Found in robots and metaverse avatars.
- Enhances human-AI interaction.

F - Federated Learning

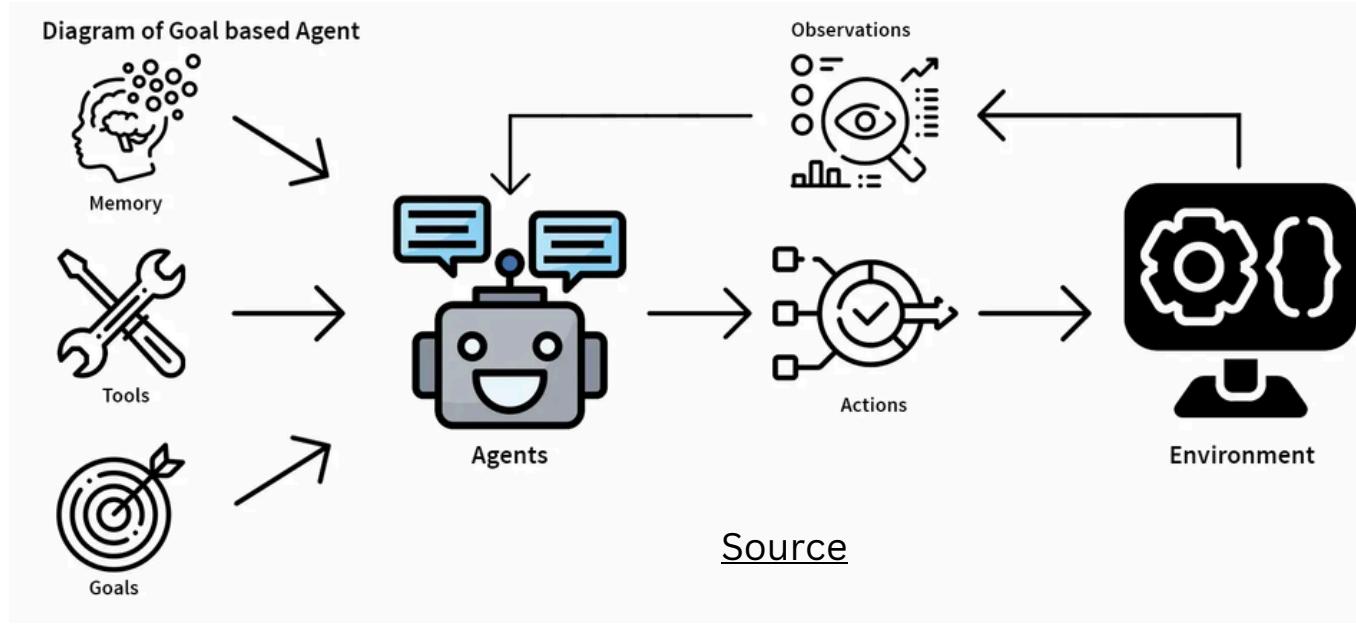

AI learns from decentralized data sources.

- Preserves privacy.
- No need to share raw data.
- Used in healthcare and mobile AI.

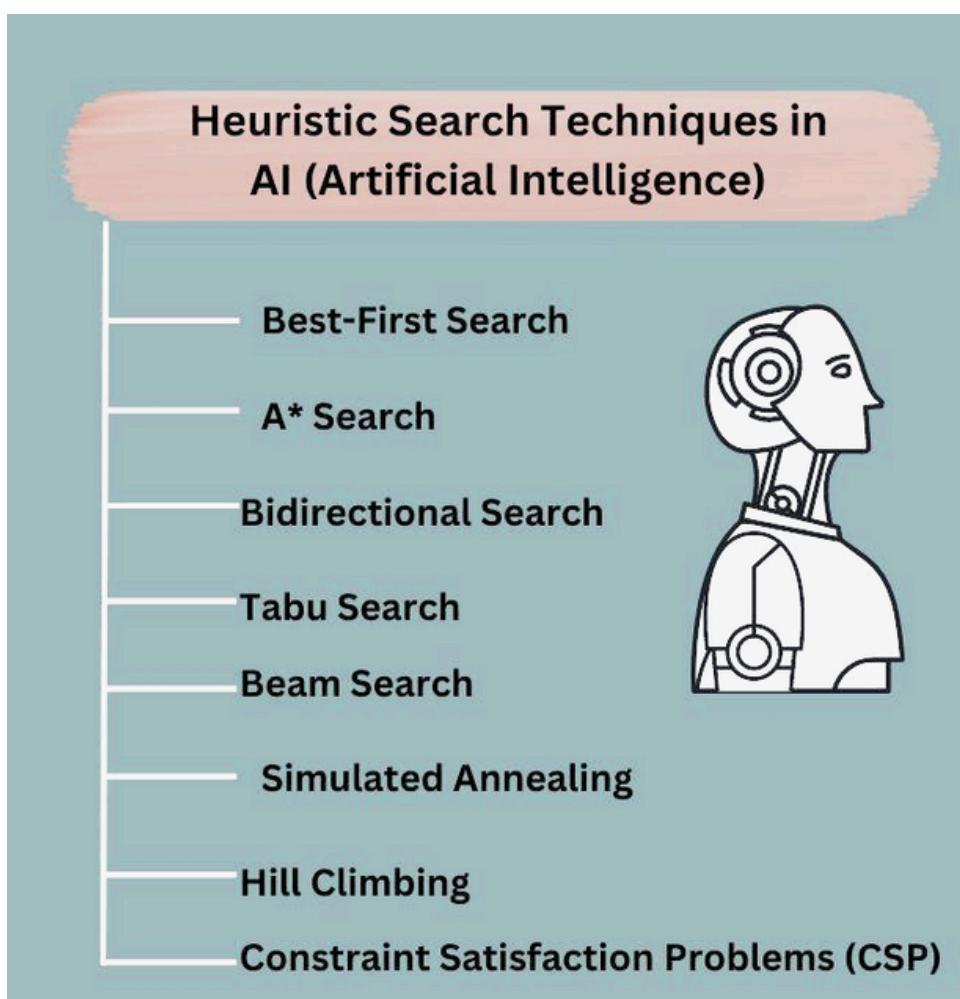

G - Goal-Oriented Agent

An AI agent designed to achieve a specific task.

- Focuses on efficiency.
- Learns from feedback.
- Examples: Chess AI, warehouse robots.

H - Heuristic Function

A shortcut method for fast decision-making.

- Uses approximations.
- Common in game AI.
- Balances speed vs. accuracy.

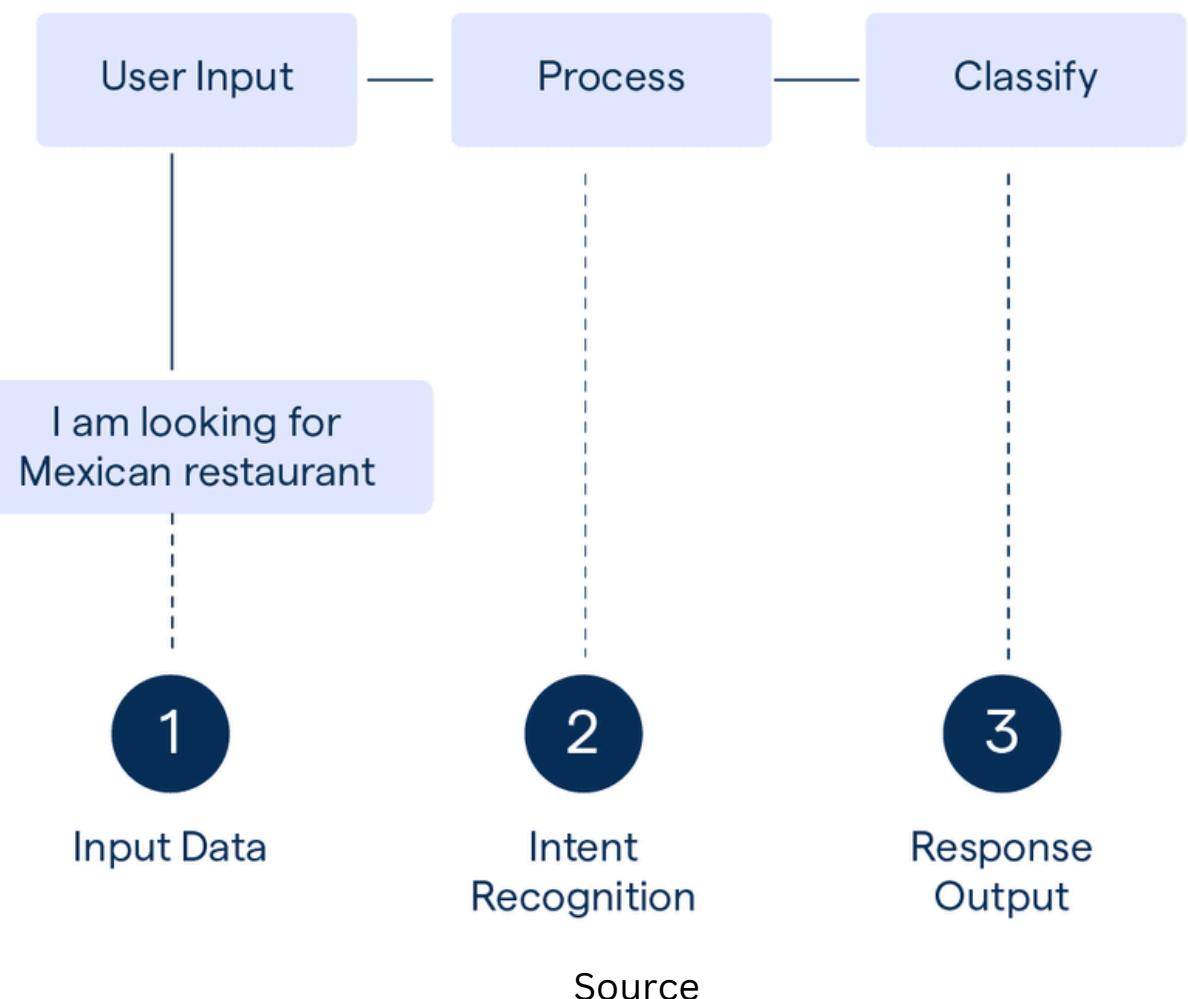

[Source](#)

I - Intent Recognition

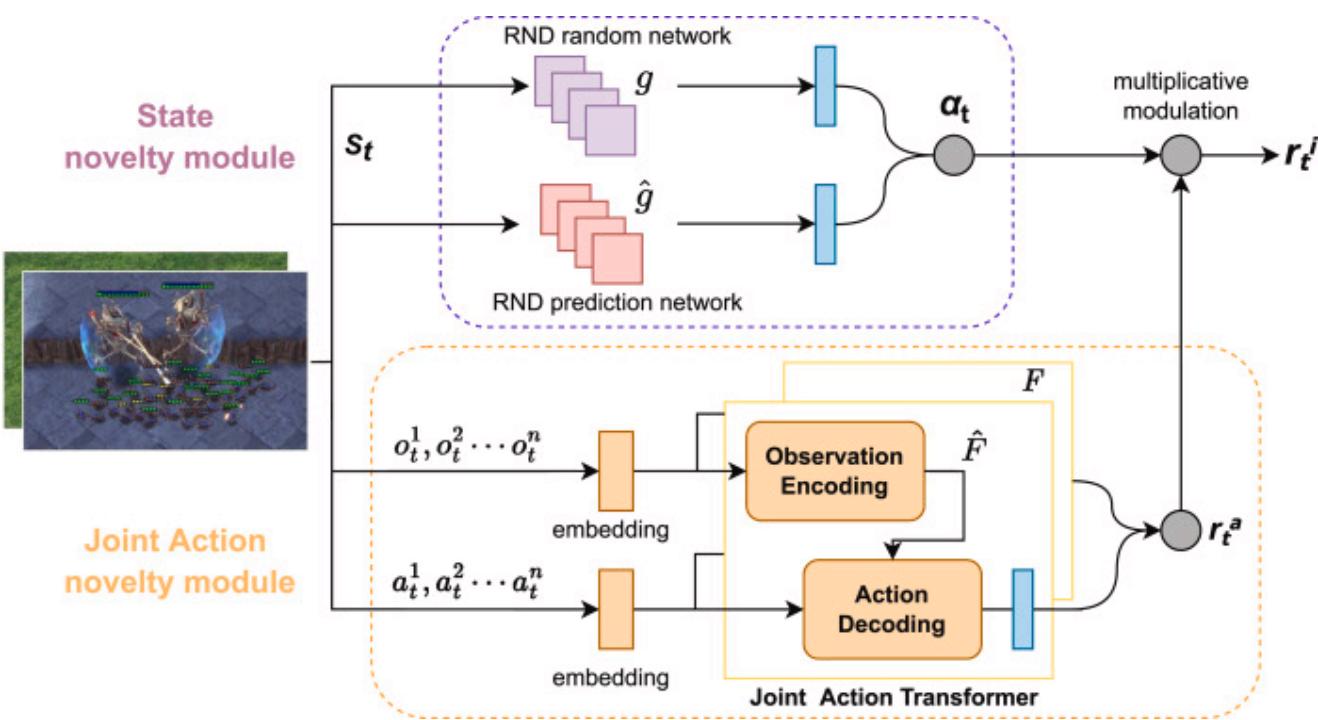

Intent Recognition

Understanding user goals in conversations.

- Essential for chatbots.
- Uses NLP and context clues.
- Improves user experience.

J - Joint Action Learning

AI agents learning to collaborate.

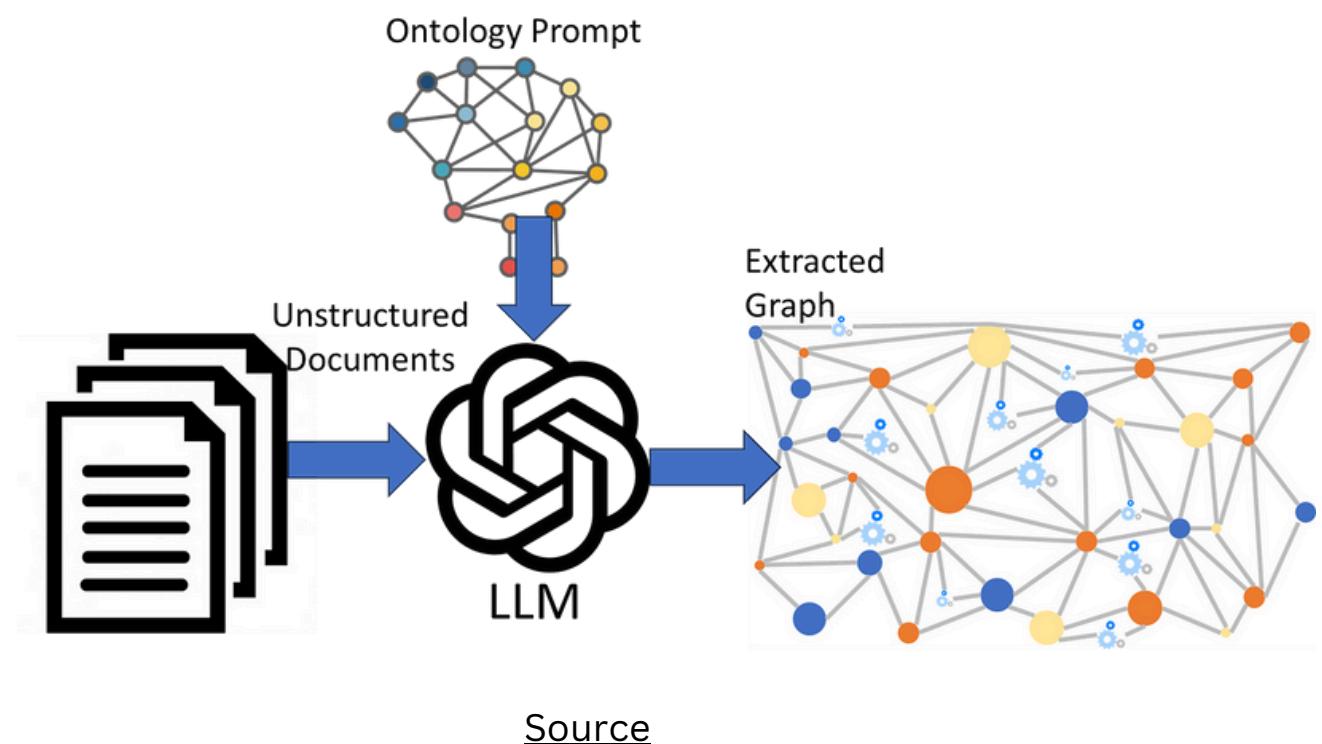

- Used in multi-agent systems.
- Helps in coordination tasks.
- Examples: Self-driving fleets.

[Source](#)

K - Knowledge Graph

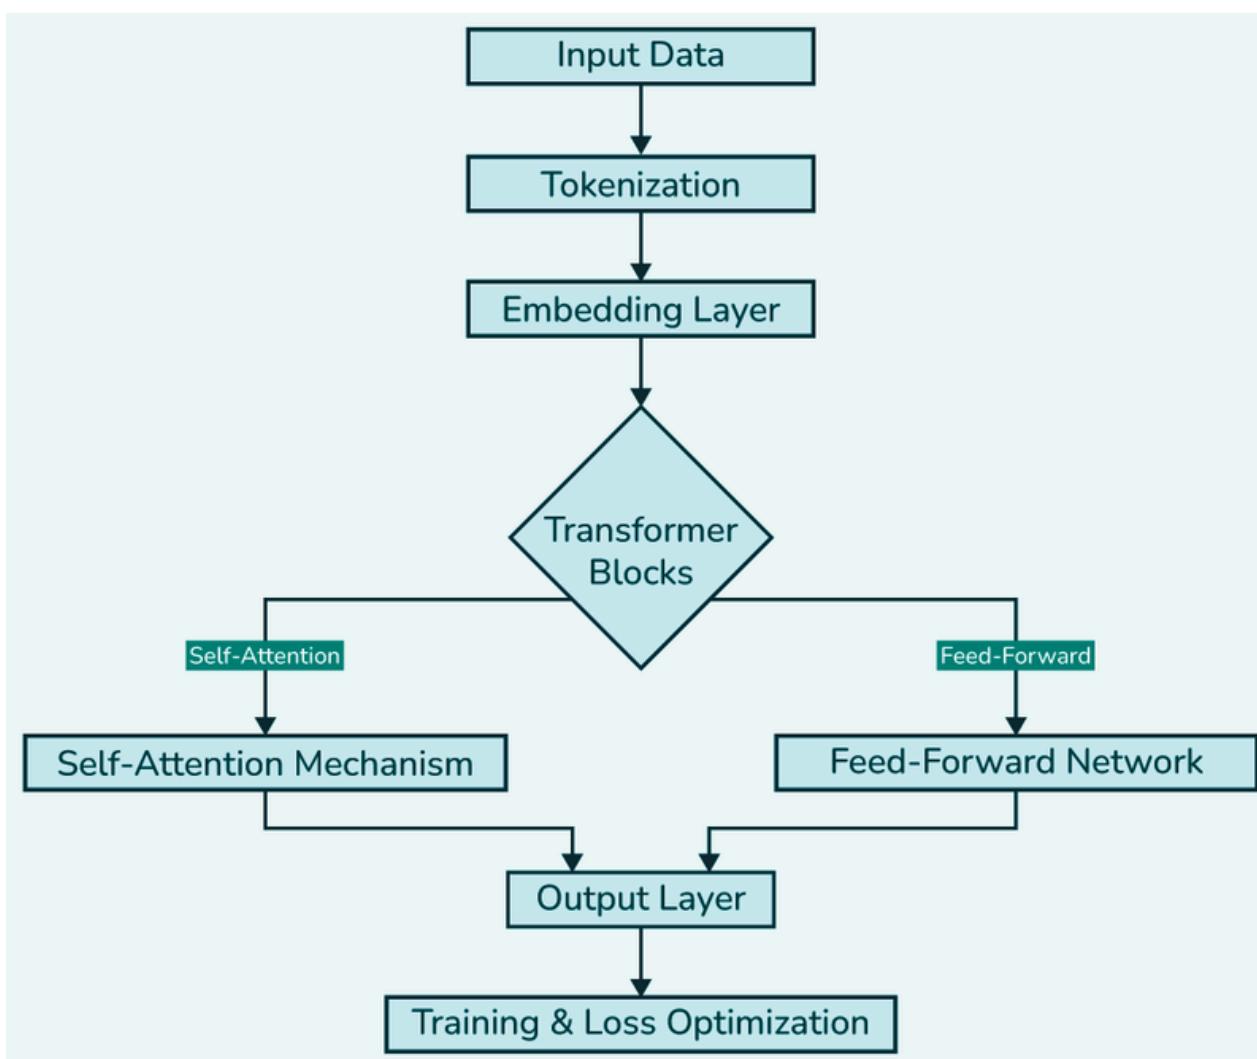

A network of connected information.

- Enhances AI reasoning.
- Used in search engines.
- Google's Knowledge Graph is a famous example.

[Source](#)

L - Large Language Model (LLM)

An AI model trained on vast text data.

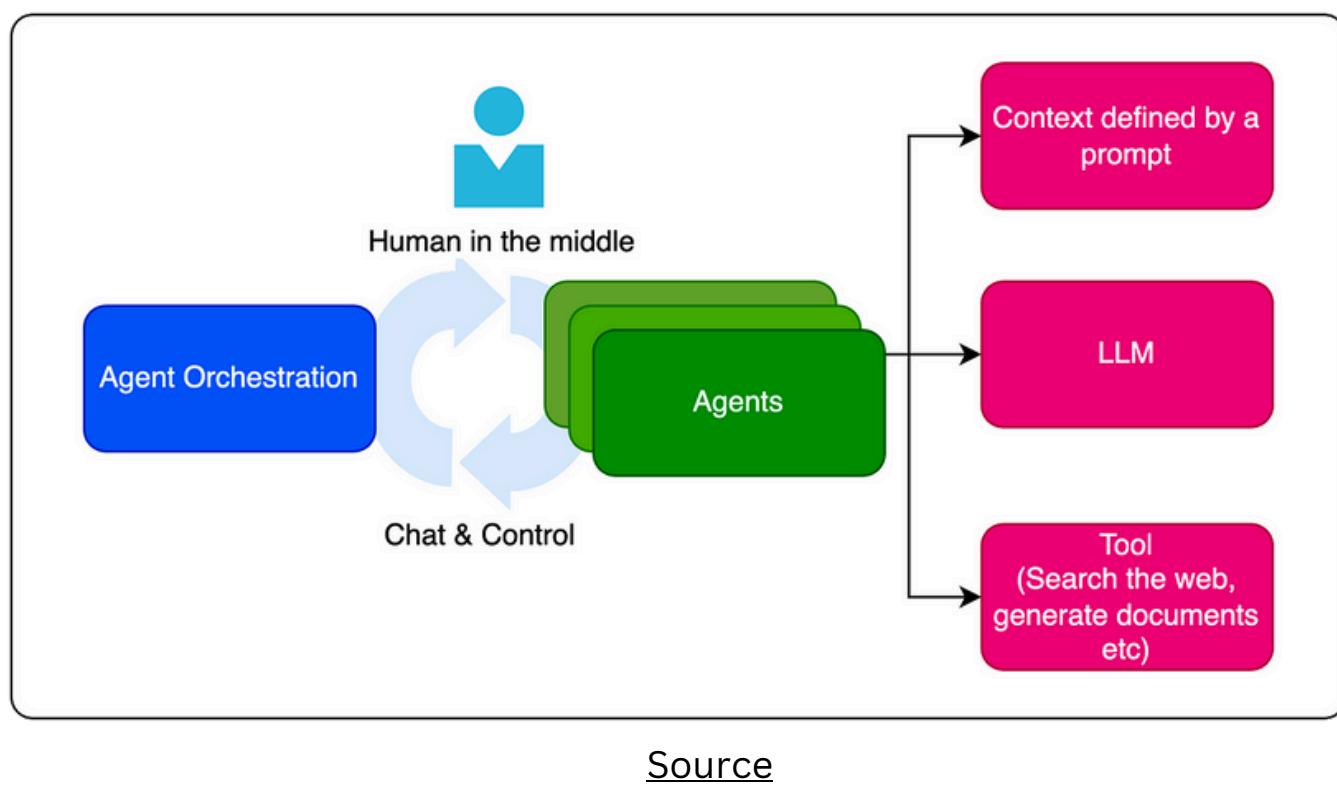

- Generates human-like text.
- Can answer questions, write code.
- Examples: GPT-4, Claude, Gemini.

[Source](#)

M - Multi-Agent System (MAS)

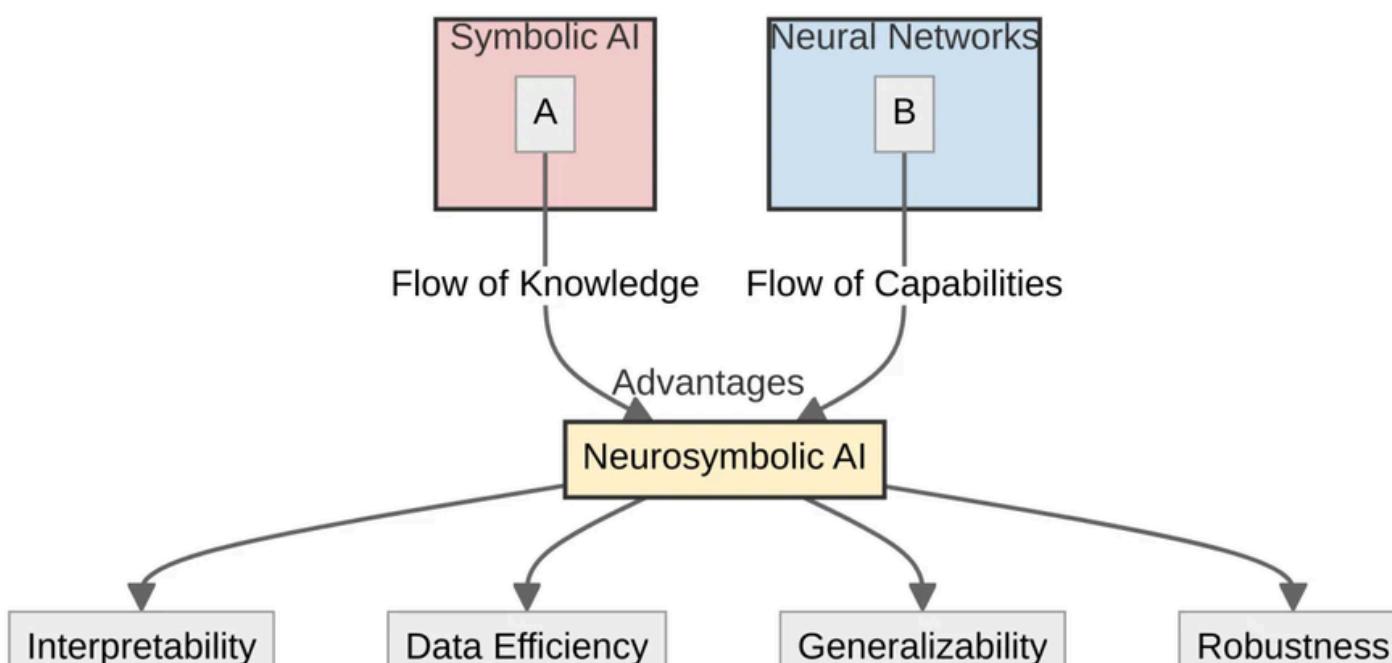

A system of AI agents working together.

- Decentralized decision-making.
- Used in simulations, trading bots.
- Inspired by swarm behavior.

[Source](#)

N - Neural-Symbolic AI

[Source](#)

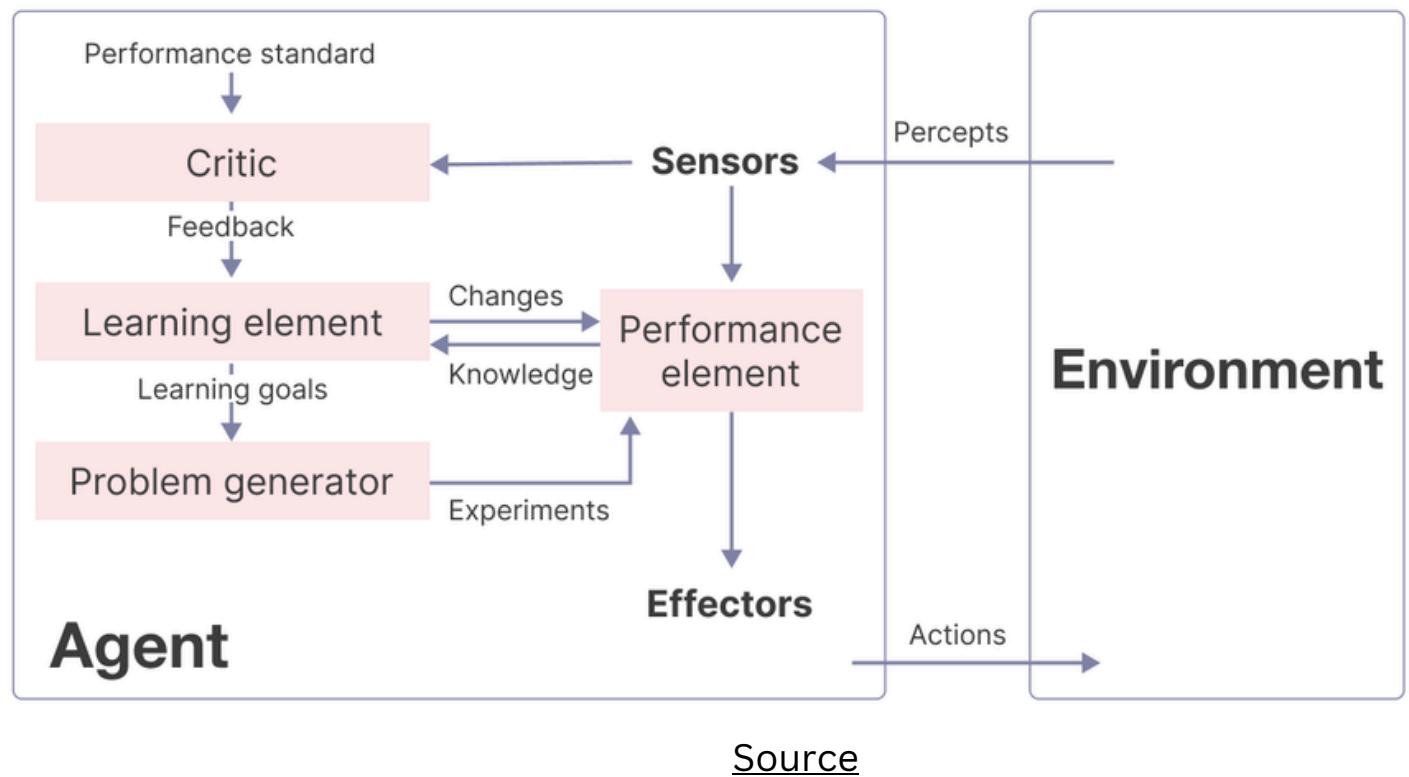

Combines deep learning with logical reasoning.

- Bridges neural networks & symbolic AI.
- Enhances explainability.
- Useful in law and science AI.

O - Online Learning

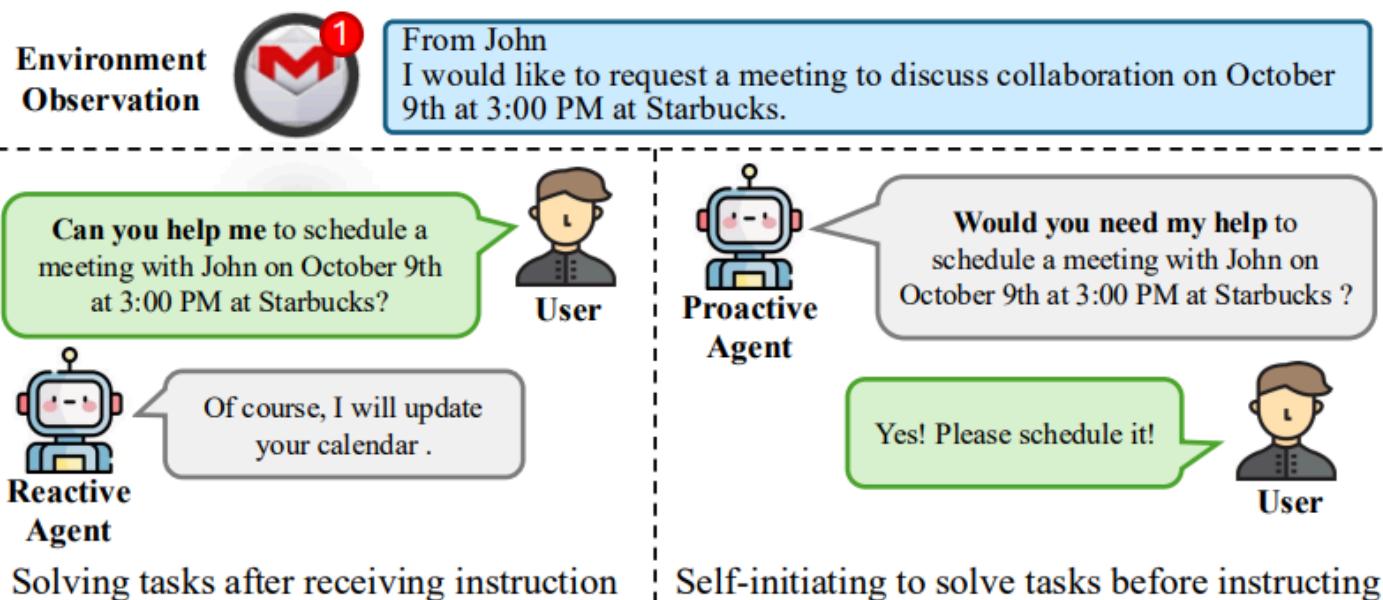

AI that continuously updates its knowledge.

- Learns from real-time data.
- Adapts to changing environments.
- Used in recommendation systems.

[Source](#)

P - Proactive Agent

Anticipates user needs before being asked.

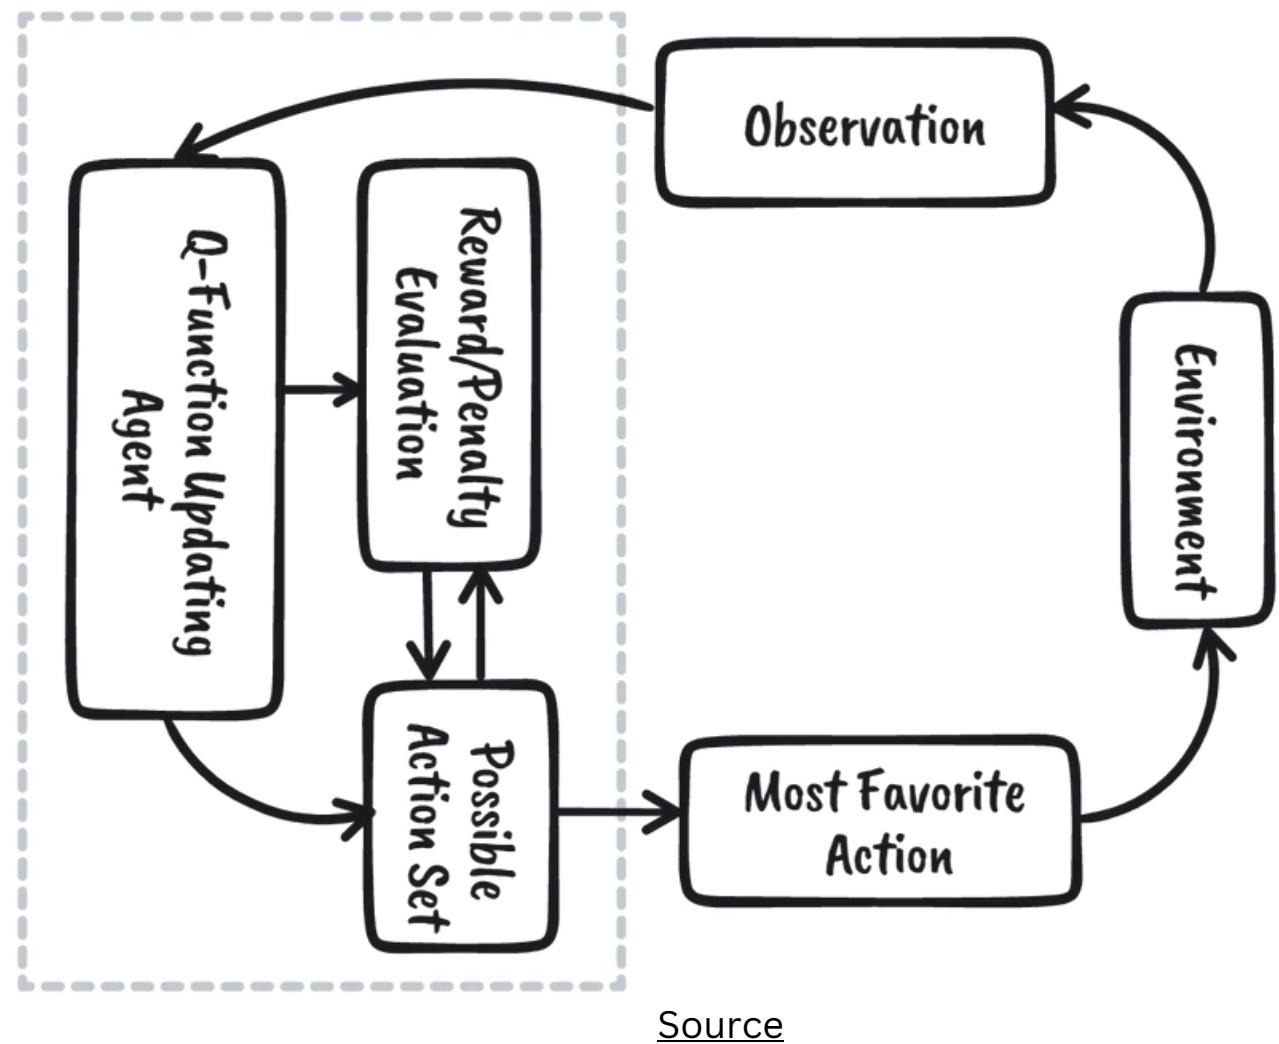

- Takes initiative in decision-making.
- Improves automation efficiency.
- Found in smart assistants.

[Source](#)

Q - Q-Learning

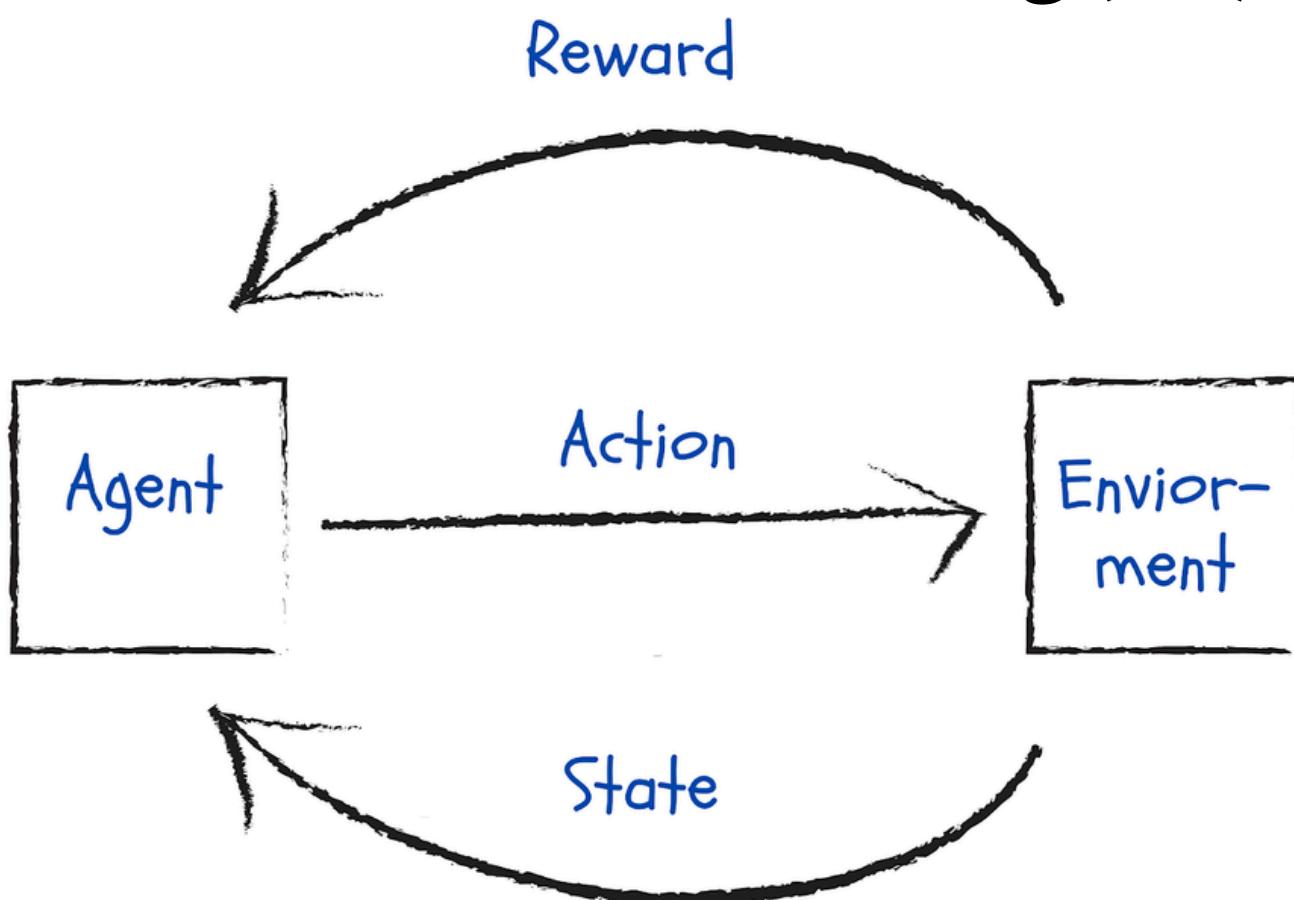

A reinforcement learning method.

- AI learns through trial and error.
- Uses rewards to improve decisions.
- Core of self-learning AI.

[Source](#)

R - Reinforcement Learning (RL) Agent

[Source](#)

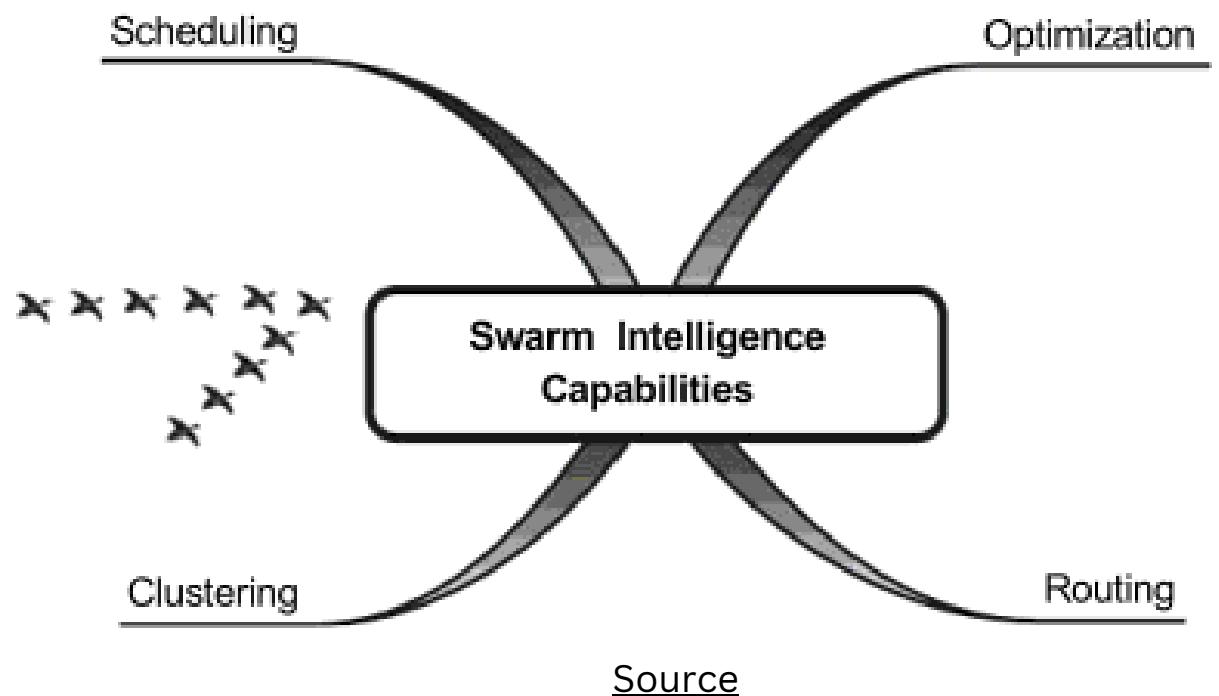

An AI that learns by maximizing rewards.

- Improves over time.
- Used in robotics, gaming.
- Example: AlphaGo.

S - Swarm Intelligence

AI inspired by collective behavior in nature.

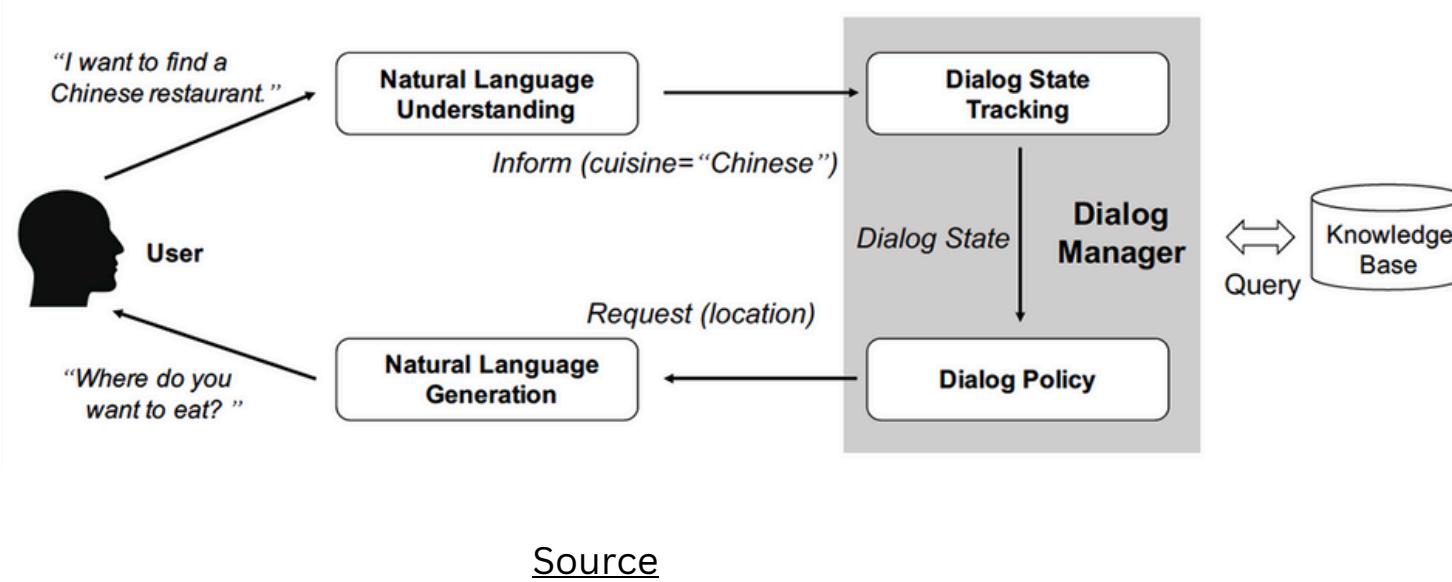

- Decentralized problem-solving.
- Mimics ants, bees, birds.
- Used in logistics, traffic control.

[Source](#)

T - Task-Oriented Dialogue System

AI designed for specific tasks.

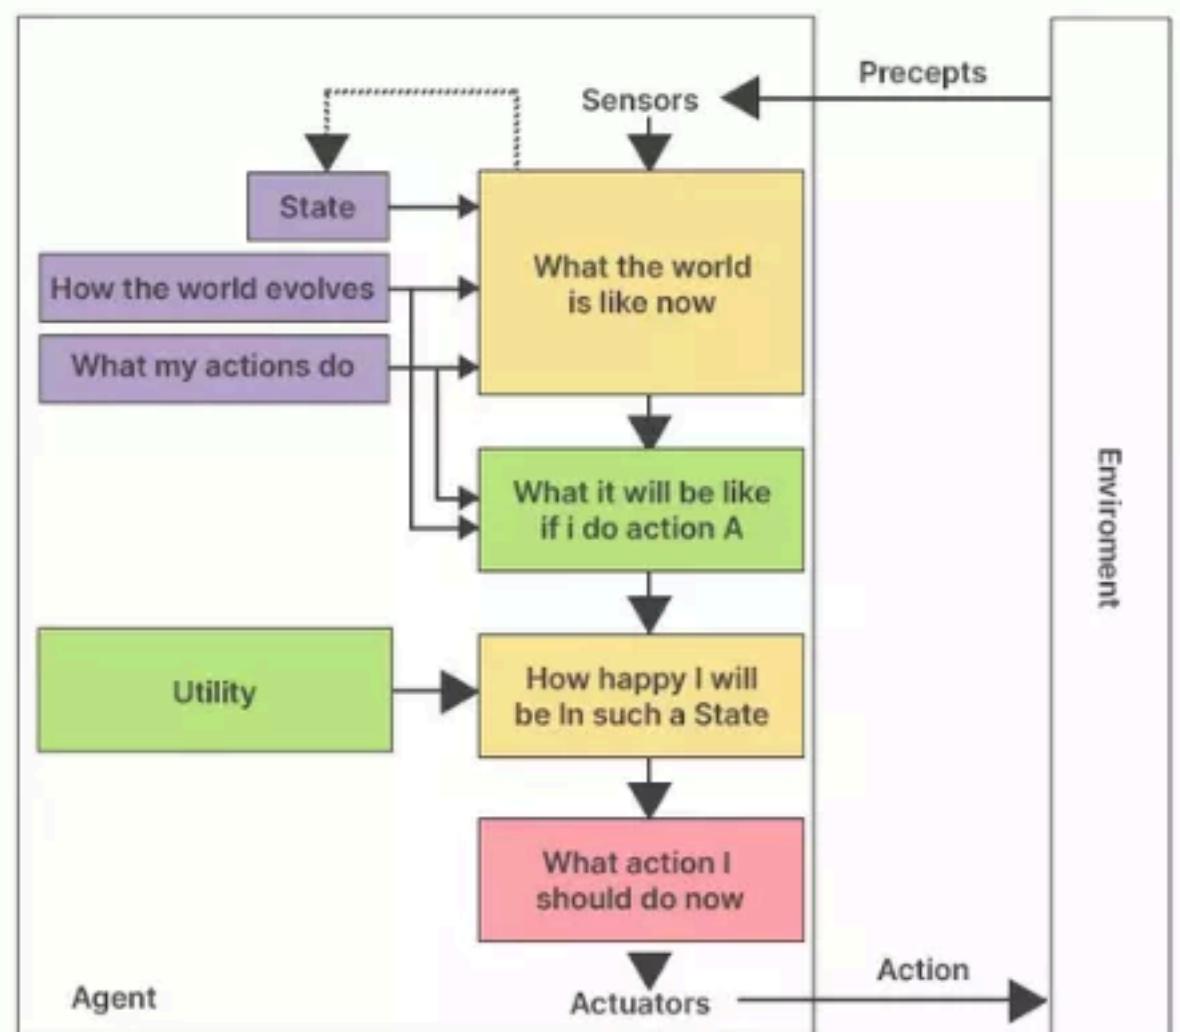

[Source](#)

- Optimized for efficiency.
- Limited to a domain (e.g., flight booking).
- Example: Customer support bots.

U - Utility-Based Agent

Chooses actions based on the highest utility.

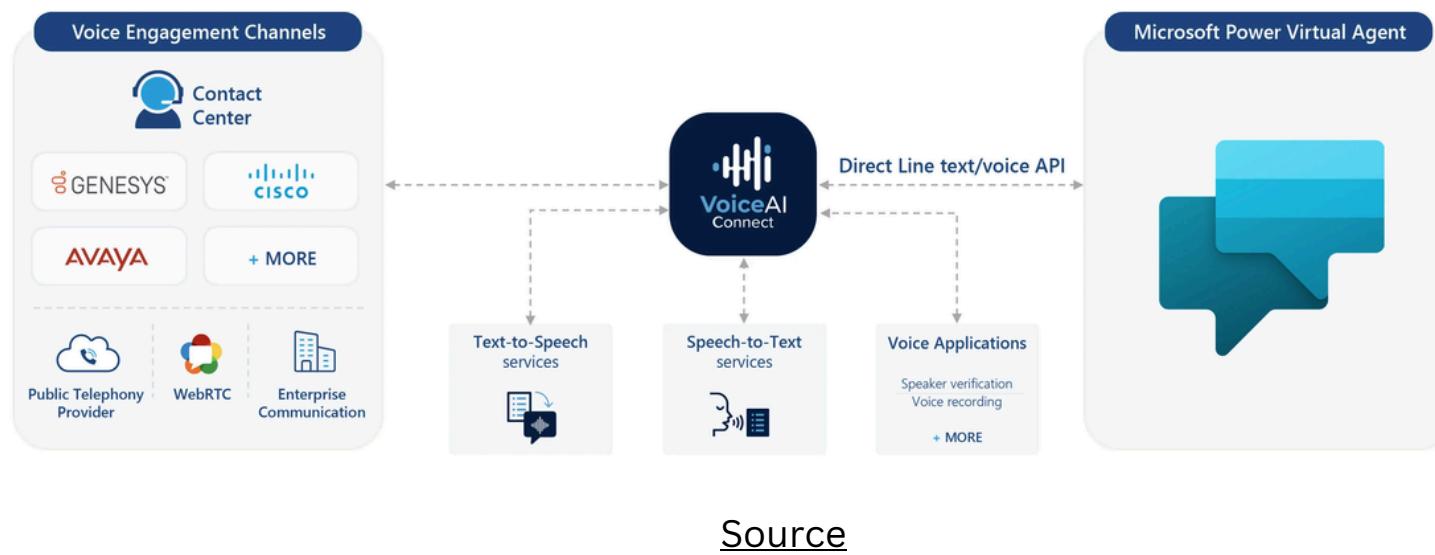

- Maximizes performance.
- Used in economics, robotics.
- Evaluates trade-offs.

Source

V - Virtual Agent

AI-driven digital characters or bots.

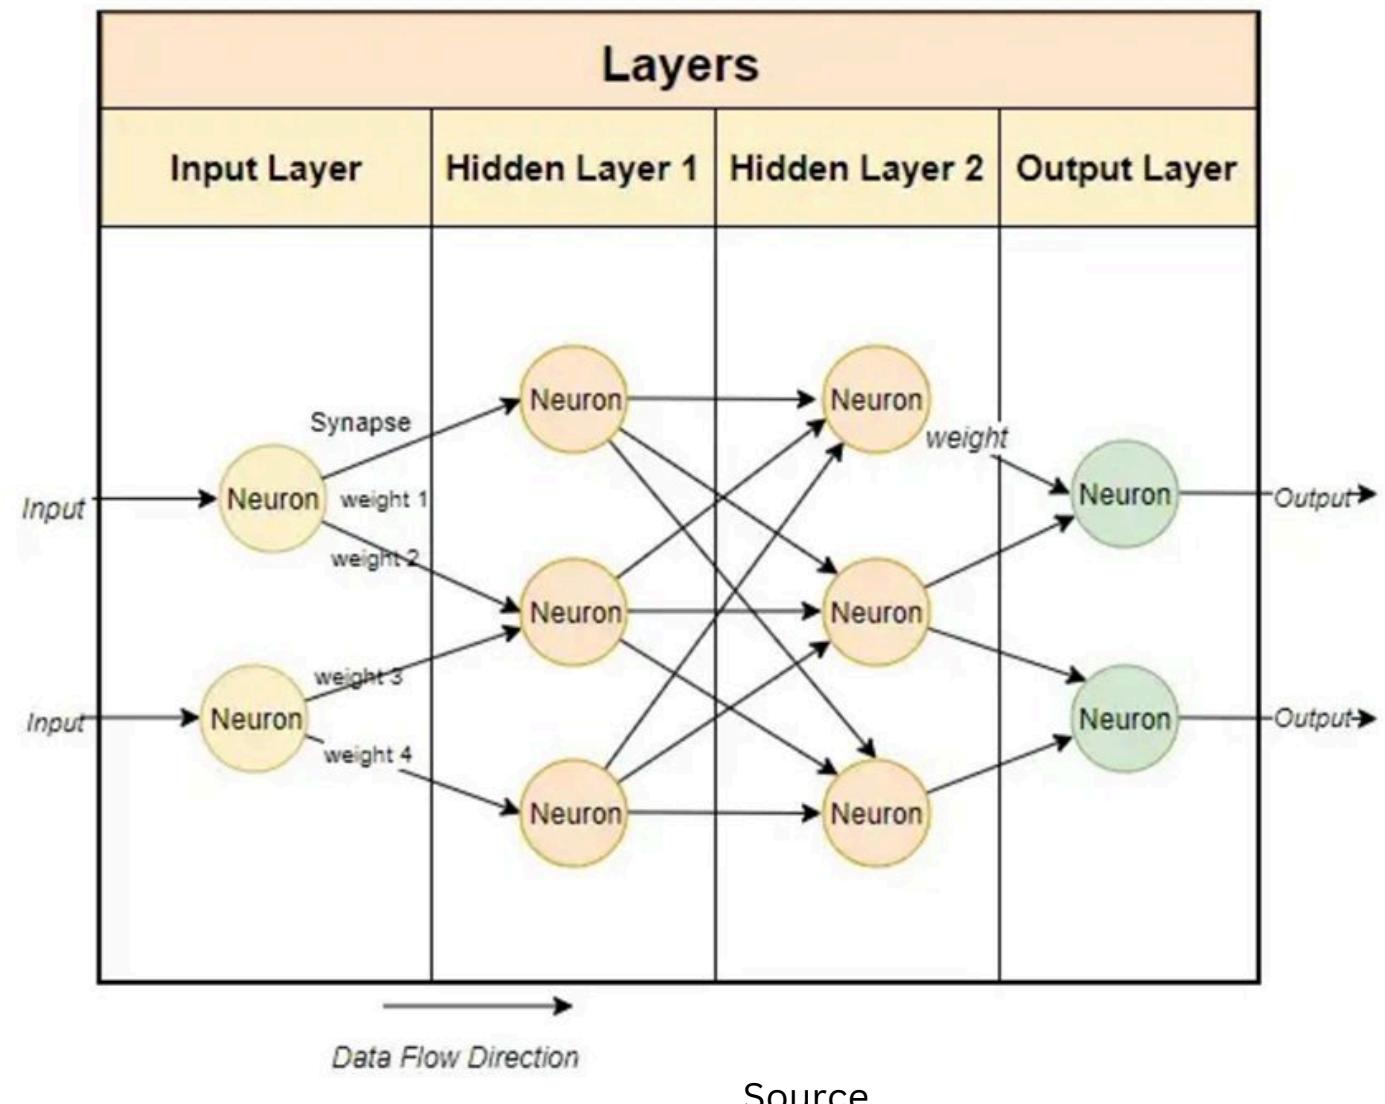

Source

- Interacts in virtual worlds.
- Can be 2D or 3D avatars.
- Used in gaming, training simulations.

W - Weighted Action Selection

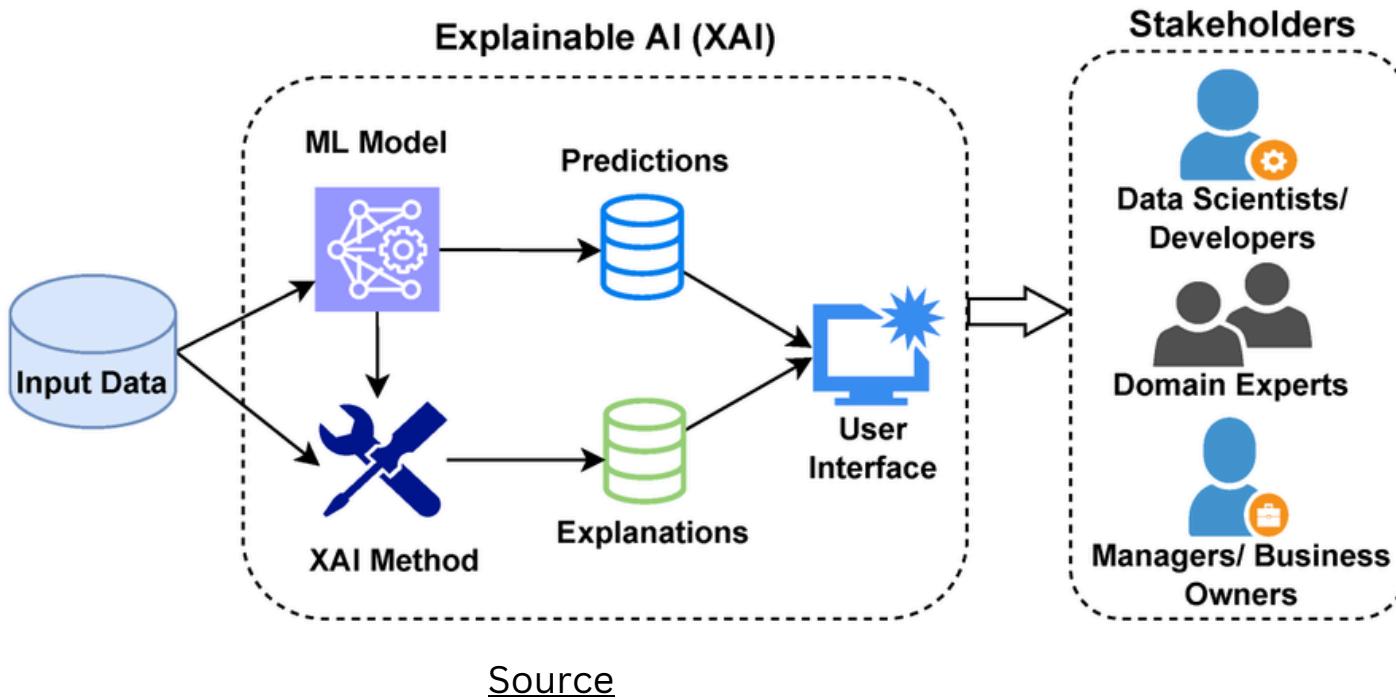

A technique to prioritize AI decisions.

- Assigns different weights to actions.
- Balances risk and reward.
- Used in strategic AI.

[Source](#)

X - Explainable AI (XAI)

[Source](#)

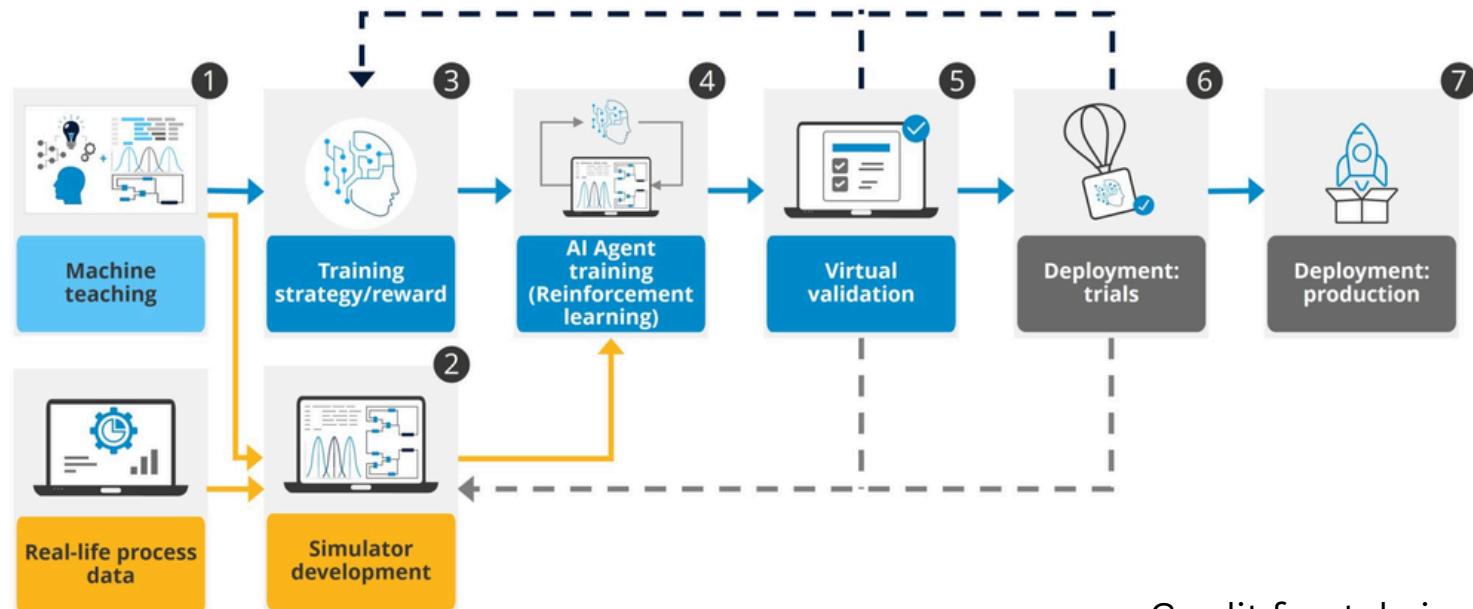

AI that provides human-understandable reasoning.

- Reduces AI "black box" issues.
- Important for trust and ethics.
- Used in healthcare, finance AI.

Y - Yield Optimization

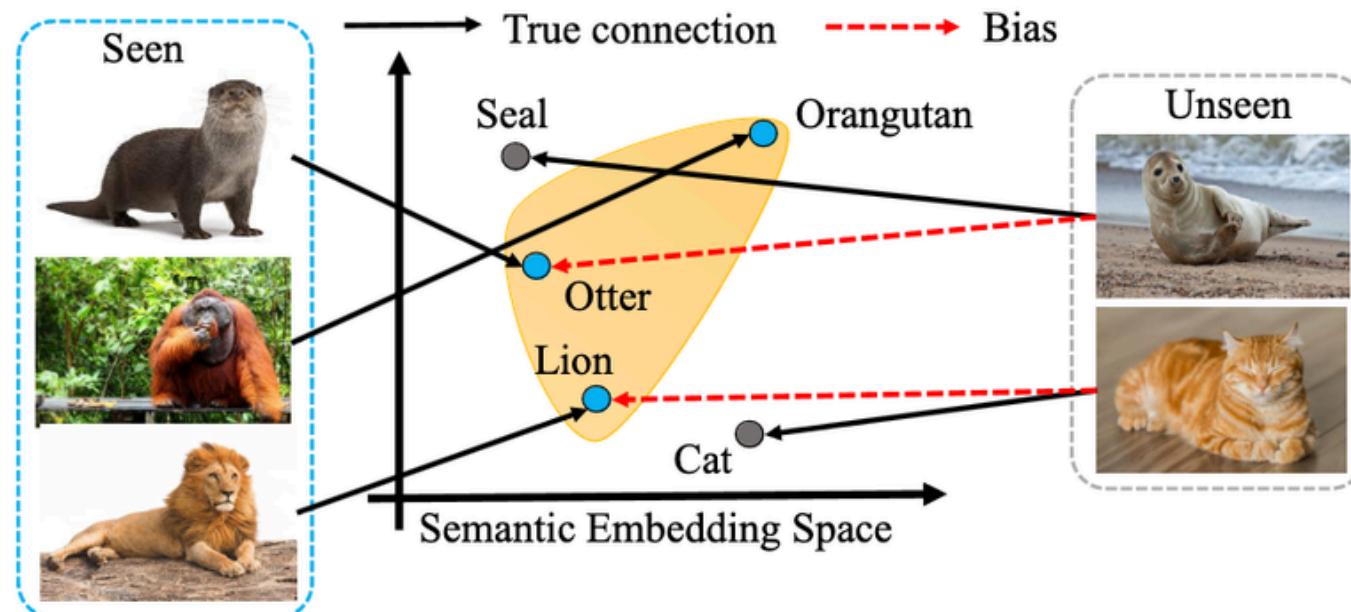

Maximizing output relevance and efficiency.

- Improves response quality for fine-tuned models.
- Involves iterative adjustments and monitoring.
- Enhances user satisfaction in real-world use.

Credit:fractal.ai

Z - Zero-shot learning

Performing tasks without task-specific fine-tuning.

- Leverages general knowledge from pretraining.
- Useful for quick adaptation to new domains.
- A hallmark of advanced LLMs.
